### Introduction

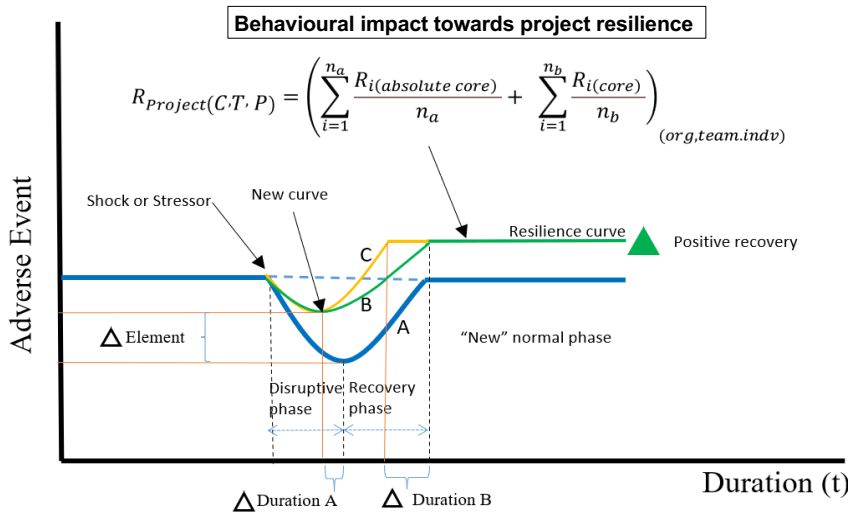

A project is continually overloaded with conditions and events that introduce uncertainty, making it difficult to forecast them and disrupting project management (Caralli et al., 2010; Naderpajouh, 2020). Since projects are complicated, project management and solutions are not always straightforward and adaptable. This can result in poor project solutions and adverse events (Bellandi et al., 2021). Therefore this study focus on project management disruptions and how to prepare for them by identifying behavioural characteristics that promote resilience. This will help businesses to develop strategies and tactics to help project teams anticipate, mitigate, and recover from adversity.

### Method

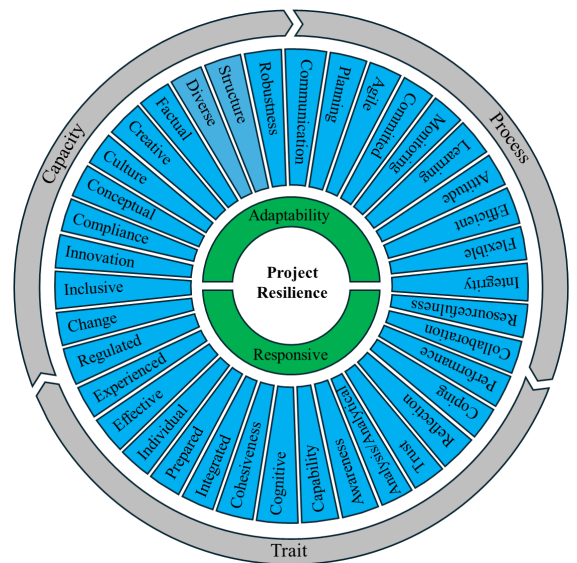

- Investigate resilience in the domains of organisational, team, individual, and project resilience.
- Investigate common perspectives across the domains.
- Assessing various resilient scales and conceptualisations to identify behavioural characteristics that promote resilience.
- Using the Delphi method to obtain qualitative and quantitative data to determine consensus on identified behavioural characteristics.

### Discussion

This model is unique compared to others as it addresses project resilience through the perspective of the individual and by doing so the project team. Making use of the behavioural characteristics, team members can be evaluated to determine their current resilient state and also determine which core behavioural characteristics are required to foster resilience.

Project resilience model

### Objective

What behavioural characteristics influence resilience at project level when looking at the domains of resilience and various perspectives from which it is approached..

### Results

- Of 43 identified behavioural characteristics, high consensus was achieved on 38 behavioural characteristics and absolute consensus was achieved on two of the 43 behavioural characteristics.
- Two characteristics are classified as “absolute core”.
- Thirty eight (38) behavioural characteristics are classified as core.

### Conclusion

Behavioural characteristics plays an important role in project management resilience. Implementing strategies to improve resilience on each behavioural characteristic improves recovery during known and unknown adversity, thereby improving project resilience.
